

Ultimate Viva & Topic Checklist for MessFinder

GENERAL PROJECT QUESTIONS

- What is MessFinder?
 - Why did you build this project?
 - What problem does your app solve?
 - Who are your target users?
 - What makes your project different from others?
 - What are the core goals of your project?
 - What is the real-life application of your project?
 - Is this idea inspired by any existing apps?
 - How does your app help society?
 - What challenges did you face while building it?
 - How can this project be improved in future?
-

TECHNOLOGY STACK (What / Why / How)

- What tech stack did you use?
 - Why did you choose React?
 - What is Firebase and why did you use it?
 - What is Tailwind CSS and how is it different from Bootstrap?
 - What is Vercel and what does it do?
 - Why did you choose Vite instead of CRA?
 - What are the advantages and disadvantages of Firebase?
 - What does NoSQL mean in Firestore?
 - What is the role of Firebase Storage?
 - What is React Router used for?
 - What are the benefits of using a serverless architecture?
 - What is SPA (Single Page Application)?
-

FRONTEND-RELATED QUESTIONS

- How did you manage routing in your app?
 - What is a React component?
 - What is `useState` and `useEffect` ?
 - How is state management handled in your app?
 - Did you use Redux or Context API?
 - How did you implement responsive design?
 - How did you validate your forms?
 - How did you handle dynamic routes?
 - What is the folder structure of your project?
 - What happens if a route is not found?
-

BACKEND / FIREBASE-RELATED QUESTIONS

- How does Firestore store data?
 - What are collections and documents in Firestore?
 - What are Firestore security rules?
 - How do Firebase rules protect your data?
 - How is user authentication handled?
 - How are user roles stored and used?
 - How is data read/written to Firestore?
 - What is the structure of your chat system in Firestore?
 - How did you handle image uploads?
 - What is Firebase Auth and how secure is it?
 - What are the limitations of Firestore?
-

SECURITY & ACCESS CONTROL

- How does your system ensure security?
- What is role-based access and how is it implemented?
- Can a user access owner-only features?
- What prevents fake data submission?
- How is your chat secured?
- How are passwords stored in Firebase?
- What is HTTPS and why is it important?
- Can someone hack your frontend and gain access?
- What if someone tries to write data directly to Firestore?

- How do you secure sensitive data during transmission?
-

FEATURES / FUNCTIONALITY

- What are the main features of MessFinder?
 - How does the chat system work?
 - How does search and filter work?
 - How does a user find a room?
 - How does a PG owner post a listing?
 - Can a user save PGs?
 - How are images handled in the app?
 - Is real-time sync available?
 - How are listings verified?
 - Is there a review or rating system?
-

DESIGN & DEVELOPMENT

- How did you plan the system flow?
 - What is your development process?
 - Which SDLC model did you follow?
 - What were the stages in building your app?
 - How did you test the application?
 - What tools did you use for design?
 - What is the database schema?
 - How did you manage responsiveness?
 - What are the different modules of your app?
 - How are user flows managed?
-

DEPLOYMENT / HOSTING

- Where did you host your frontend?
 - How does Vercel handle deployment?
 - Where is your database hosted?
 - Is your hosting free or paid?
 - How do you update your app once deployed?
 - What is CI/CD and do you use it?
 - What happens if Firebase or Vercel goes down?
-

FUTURE PLANS / EXPANSION

- What features do you plan to add in the future?
 - How will you implement map-based search?
 - Will you add payment integration?
 - How can you implement review and rating?
 - Can you build a mobile app version?
 - How will you moderate fake listings?
 - Will you add admin or moderation panel?
 - How will you make the app more accessible?
 - How can you scale this to other cities?
-

VIVA-WORTHY CONCEPTUAL TOPICS

- Client vs Server in your architecture
 - REST API vs Firebase SDK
 - Server-side rendering vs client-side rendering
 - NoSQL vs SQL
 - Hashing vs Encryption
 - Firestore vs Realtime Database
 - Difference between authentication and authorization
 - Difference between localStorage and sessionStorage
 - State vs props in React
 - Public vs private routes
 - Static hosting vs dynamic hosting
 - CDN and how Vercel uses it
-

PERSONAL CONTRIBUTION QUESTIONS

- What was your personal contribution to the project?
 - Which feature or module did you build?
 - What part was most challenging for you?
 - How did you debug issues?
 - Did you work on both frontend and backend?
 - How did you collaborate with your team?
-
