

Great! Here's the full script for the next speaker:

Speaker 6: Subhadip

Topic: Feasibility – Is MessFinder practical and implementable?

Script (Presentation Story)

Thank you, Moumita.

Now I will talk about something very important – the **feasibility** of MessFinder.

In simple words, feasibility means:

“Is this project really possible to use in real life, or is it just a theoretical idea?”

We carefully analyzed this and found that **MessFinder is highly feasible** in many ways – let me explain how.

Technically Feasible

Our system is built with tools that are:

- Lightweight
- Easy to maintain
- Scalable for future growth

We used **React**, **Firebase**, and **Tailwind CSS** – all are free or open source, and used in real-world production apps.

There is **no need to manage a backend server**, because Firebase handles the database, authentication, and storage. That makes it easy for students or small teams to manage the app without DevOps knowledge.

Economically Feasible

MessFinder is almost **zero-cost to run**:

- Vercel and Firebase both offer generous free plans

- We don't need to buy a server or database hosting
- No monthly charges unless we hit high usage (which can be scaled later)

This makes it very affordable for local use, college-level deployment, or community startups.

User Feasibility

Our platform is built to work on:

- Mobile phones
- Low-end devices
- Basic internet connections

It does not require installation — just open a browser and use it.

So even a PG owner with limited digital skills can access it with minimal help.

Also, the interface is simple, with clear icons, forms, and chat — which makes it **easy to use even for first-time users**.

In short:

- **It works** technically
- **It's affordable**
- **It's usable** by common people

That's why we believe MessFinder is not just an idea — it's a solution that can genuinely work in real-life settings.

Now I invite **Puja** to explain **how we built this system step by step**.

Tips for Subhadip:

- Define "feasibility" at the start for clarity
 - Emphasize how *affordable* and *accessible* the system is
 - Use examples like: "even a local PG owner can use it"
 - Speak with a practical, confident tone
 - End strong: "not just an idea — a working solution"
-

Likely Viva/Panel Questions for Subhadip:

Q: How much will it cost if 1,000 users use it daily?

A: Still within the free Firebase tier for most features. Beyond that, only storage or Firestore may need billing — and that's scalable.

Q: Can this run offline or without internet?

A: No. Since it's a web-based app and uses cloud database, it needs internet to work.

Q: What if Vercel or Firebase limits us?

A: Both platforms offer scaling. For large usage, we can upgrade or migrate to other cloud services.
