

Here we go! Here's the complete presentation script for the next speaker:

Speaker 9: Aakash

Topic: User Roles and Flow – How does the system work for different users?

Script (Presentation Story)

Thank you, Susanta.

Now I will explain the **user roles** in our system and how the overall flow of the MessFinder application works – from both the **user side** and the **owner side**.

We designed this system with **two main roles**:

1. The **User** (or Room Seeker)
2. The **Owner** (who posts rooms)

Let me explain the experience for both, step by step.

USER ROLE – For Room Seekers

A general user can visit the website even without logging in.

User Flow:

- They start on the **homepage**, where they can enter a **location or keyword** to search for rooms.
- After submitting the search, they are redirected to the **search results** page.
- Here they see a list of PGs with filters like mess type, accommodation type, and price.
- By clicking on a room, they go to the **room details** page.
- If interested, they can **login** (email/Google) to:
 - Chat with the owner
 - Save the room for later
 - View their activity dashboard

This makes it very easy for seekers to explore, shortlist, and communicate – all from one platform.

OWNER ROLE – For PG Owners

We've also created a smooth experience for PG owners – they just need to **select "Owner"** as their role during signup.

Owner Flow:

- After login, they are taken to the **owner dashboard**.
- From here, they can **update their profile** (name, contact info, etc.).
- They can go to the **Submit PG** section and fill out details like:
 - Room name, description
 - Rent, mess type, who it's suitable for
 - Upload images
- Once submitted, their room appears in the search results for everyone to see.
- They can also receive and reply to **messages from seekers** in real time.

This system gives owners complete control over their listings, and they can manage everything from a simple dashboard.

Common Features

Both users and owners use **the same app**, but they see different features based on their role. This is done using **role-based access**.

- Users cannot submit PGs
- Owners cannot search rooms
- Only logged-in people can chat or save data

This helps keep the system **organized and secure**.

To summarize:

The seeker finds a PG → logs in → chats with the owner → finalizes the visit

The owner lists their PG → gets messages → updates profile or listings as needed

Now I would like to invite **Susanta again**, who will explain how we ensured **security** and kept user data protected.

Tips for Aakash:

- Walk through both roles like a user story — make it visual
 - Emphasize clarity and separation of roles
 - Speak naturally when listing actions: “they search... they view... they chat...”
 - Show confidence in your system’s logic
-

Likely Viva/Panel Questions for Aakash:

Q: Can someone register as both user and owner?

A: Currently, during signup they choose one role. If they want to change, we can update it manually or allow that in future updates.

Q: How are roles managed in Firebase?

A: We store the role in Firestore under the user document, and use that role to conditionally render pages and restrict access.

Q: Can users contact owners directly outside the platform?

A: Yes — owners can choose to share their phone number or email in the profile, but chat is also available within the app.
